why not?

ROBBERT BRANTZ

Preface

WHY NOT?

I might be a fool, a strange thinker, a freak, why are all these reflections in my head. Are these ideas that I have written in other peoples head? Every moment new ideas popping in my head, not for a specific reason. Family, friends and companies who need ideas respect this mostly it is disturbing the thoughts of many that things will never change.

As the typewriter probably once was a threat for writers. The “why not” is bigger than the anxiety for change. Here are some ideas for now or for tomorrow, why not think about it. Many ideas probably exist throughout the world, I do care, because the future is more nearby.

SLEEPING FLIGHTS, SOLAR CRUISES AND FEATHER SUITS

The first start of inventing flying, people used birds feathers to jump off the roof with risking of their own lives.

The romantic idea of giving your live for a world changing invention is still in our system. The creativity however is bound to rules of safety because flying is now public transportation, but exhausting nature in all its aspects.

The most polluted air areas in the world are in the neighborhood of airports; a single flight from Amsterdam to New York is using enough energy for one household for a whole year in cold Europe. So flying must be smarter, more green and modernized.

The machines we call airplanes are standardized. We could change some material to have a better experience or view, but real inventions are copying nature, introducing feathers, studying the birds again or using cabins.

Sleeping flights, sleep, safe space, safe landing

The sleeping flight idea is as easy as it sounds. Why not drug people in a plane? You step into a plane, get drugged by a nice steward or stewardess and hours later you wake up in another place on the planet. Throw all the chairs out of the plane and replace them with personal cabins, where you fit in and you can lock it from the inside. The cabins realize the perfect temperature for a good healthy sleep, the right oxygen value to breathe. The impact of the sleeping flight is to travel and land full of energy.

When you check in, you install yourself in the personal cabin, your hand luggage is boxed

at your feet so you are sure it is locked in. Finally you fall in a deep sleep as if, you are not in the airplane yet. You awake on the ground in the other part of the world, you are already out of the airplane.

The airplanes will be more flat and therefore more aerodynamic in the end. People don't need any space more than their body length and weight (and a small space for luggage). There is no need of toilets where you can walk, no need for catering drinks and food, no need for videos, music and selling stuff.

In case of a flight accident the cabins can have a parachute, are able to float on water and with a oxygen capsule to have enough air to reach the ground.

Cabins are personal, so you always are in your own air, the cabins are disinfected. It isn't strange to have family cabins, where you can sleep with your children, even creating more space.

Long (thermic) solar cruises

Have you ever jumped with a parachute? It is really silent up there. Our airplanes give the impression that it is frighteningly noisy in the sky, but the opposite is true. Is it speed that is the controller of flying or is it the experience that can be sold. Why not flying from Amsterdam to New York on a silent solar flight, visiting all the countries you pass by, like a cruise? Why not have the possibility to take an environmental healthy (and much cheaper) solar flight, is it real that we are always in a rush?

Using everything nature offers, flying is possible without the use of kerosene. We only haven't invented it, but of course it is possible.

Feathered suits, kites and planes or a combination of them

Is the jetpack the next best level, fuel up and rise? Cutting fuel is. The real invention is

the flying person going up and down, or get on your bike and fly. No one was ever able to cross the oceans alone, this time is far behind us. If a balloon is taken by the wind why not people with the right invention? Why not be as light as balloons or feathers and sail through the sky, wearing a feather suit, hanging on a kite?

Birds got feathers...Give them something to eat and they fly and fly. Is it strange to think, why not try to get planes with feathers, flapping their wings to open sky probably keeping the passengers warm. We need to learn from nature so why not write a feather contest to get a real bird experience from a feathered plane with solar feathers? Using the thermic winds and like swallows travel 1500 miles without stopping.

TRAVELLING ONLY FOR FUN

The question about travelling is, why are we travelling in the future? And if we do, why not use our time effectively during travelling and increase our social and leisure time.

The strange thing about public transportation is that the system is very old. Traditions and inventions that are invested in, that need to be earned back, are probably the main reasons why new ideas aren't applicable. The steam train was invented in the early 1800's and the system still works but is it smart to travel on a railway or even a roadway. Is it even smart to drive and why should we, exactly just for fun.

Machine visits men

Let's start with the need to travel. It is there otherwise people never leave home anymore. With the home devices people are in a lot of jobs able to do their work, which goes further than video conferencing. Even if the carpenter can deal with a robot from home, we have distance carpenters, distance painters and other skilled persons who deal with the available robot techniques. In the time that a house is printed in a day, probably the printing and assembling process can be done by a self-driving machine powered by the virtual craftsman which is controlling the machine from his home.

Only for fun

Travelling to the supermarket is replaced by self-driving delivery cars and even the doctor can measure the temperature and check the urine balance through the standard equipment you have at home. Your home smell system tells you when to travel or better stay at home, with the right techniques travelling will be totally replaced. Travelling in the future is only needed for fun and of course if you travel for work it is mostly for fun or you work on the way in more effective hubs.

Effective travel time management

As we know for sure, travelling is not effective if the decision or action you have to take as a group also comes through without that travelling time. For example if 10 persons need to travel average 1 hour (forth and back) for a meeting of 2 hours then already 10 hours travel time is lost. If the decision the group needs to take is less than 30 hours, you save time. Every system that creates the effective use of conferencing time making an end to the need to travel.

Self-driving hubs – the loss of offices

Why not have conferencing hubs, automated hubs that pick you up at home and the meeting starts from that point. Everybody involved in the meeting is collected at their homes and after one hour all people are sitting together to make the decisions. During this decision making time everybody stays in the hub. When it comes to action people know now when a person is delivered at home, so the actions will be sorted out in this scheme. In the future the office is at home and the office building is a hub depot organizing conferencing hubs.

STAR NAVIGATION AND CULTURAL DISTILLERS

We have a long history in navigating through the celestial system, the moon and the stars. Even butterflies and other animals can travel thousands of miles because of this system. Why not use the sun, moon and stars?

Real emperors and kings needed to navigate and locate new areas. Think about it, some wooden boats, a few instruments and the war was on until there was a winner. The basic was very simple and data intelligence nothing compared to the future.

Star navigation – natural satellites

The satellites are fighting for a place in space, why not using the sun, the moon and other systems or is it just for spying purposes? Why use satellites when you are able to arm flees with mini cams in the future? Back to the reality enough reasons to go back to the natural satellites, inventing systems that use the moon, sun and stars. Even the safety of self-driving cars and this system will come through.

Geography big data and culture distiller

Our global possibilities to move or to interact with other countries are growing; it enriches understanding and speeds up the dialogues. Is it reality to discuss business or other things with people, whereas you don't know where they come from? Is it enough to be on the clean surface or do we want to look underneath? See a bit of the history of the place and the country? The inhabitants, people and understand? Be more humble to the loca-

tion. Don't we have the need in the end at least knowing on the global map where at least this place is or do we step in and out only consuming not using any brains for location and navigation?

Now that we know where the person comes from, we can distillate all kinds of important stuff to make the conversation right. Communication is about positive energy, willing to understand the other person. History understands, so the impact of history is mega huge. So talking to a person in our own language, brings us to an automatic translator who explains the message but also the answer right. For example in some cultures people always say yes, but their tone of voice means no. When the big data and language distiller tells "watch out, this tone on yes means no in this country", you can continue with the discussion. The language is important but finally like the "chi" we are all bounded because of the same thing that is understanding nature and culture.

SOLAR LIGHT BULBS, DISHWASHER FITNESS AND ADAPTER FREE

Energy is everywhere, we are getting better and better in transforming energy sources into electricity. The next step is to atomize energy, in another way, every person from baby to grandpa is producing his own needed energy. By pooping in energy diapers to the energy from the wheelchairs. Houses with energy paint absorbing solar light, silent windmills /rotators in every standard building.

Solar/Rotator led light bulbs

We know led lights do not need much energy, so just the little flows that are everywhere should be able to create light. It depends on where you are what the best climate fit is. But even when the system isn't working, the human power through e.g. a home trainer is more than enough to create a boost to keep the led lights burning.

Fitness needed for dishwasher

Okay the dishwasher needs more energy. Why not going back to the banana leaves and throw away the dishwasher, but we assume the historical dishes will still be there in the future. A lot of energy is needed to have the dishwasher do its work. But what is a dishwasher really doing. Is it possible to take over some functions in the dishwasher e.g. the water pump. Why not plug in some fitness materials and after 30 minutes the dishes are done....and we have lost some weight.

Water cooking

For water cooking, heat is needed, through fire or electricity, but where are the wind cookers or the small solar cookers. Is it possible to generate boiled water by walking or biking, kiting or surfing? Why not create the little water cooking devices?

Switch off 110v/220v/230v/240v

Why not switching off all the power lines that offer more than 110 volt? What machines use this kind of voltage in the future? When we have a 12 volt electrical system which in some circumstances can be transformed to a higher voltage is much greener, we ditch the adapters and have lower energy bills.

Window dressing

Last but not least, all the materials that are used are not only green but create an energy neutral environment. That means that everything that is getting energy is not the issue anymore, but generates it in an environment healthy way, without exploiting nature.

3D CONFERENCING WITH TOUCH AND FEEL

The way we communicate is still in its childhood. We think we are communicating in a very modern way, but in essence short message texting is almost like Morse code. Even sending pictures is like the cavemen painting their walls and telling stories. The big change is in the look, feel and smell. If virtual reality brings that you can smell, feel and touch people then communication is on its way to replace travelling and even make long distance relations working or more acceptable.

3d personal conferencing at home (with look and mind feel)

Why not looking at the whole body of the persons you are talking to, see how they are shaped and dressed? Maybe getting in contact in a way you can feel their presence or absence. Even more important, you have to be able to have a 'look in the eyes' feeling. So it is the next step to reach that. It is a feeling of mind, the skills to communicate will change, but think about a financial advisor or tax advisor who pops in at home and can give the trust with their holographic presence by being in the room.

Far beyond the current service systems, why not pulling in the helpdesk employee into your home and show him your problem with the product. Look the in the eyes and get the right feeling by the solution they are offering. Understanding through look and mind feel.

3d personal communicating (with look and touch and feel)

The next challenge is to communicate with the ability to touch, look and feel. What if you can communicate with "robots" who take over the body temperature of the person you

are talking to, have a virtual skin which you can press, touch and feel. The handshake or kiss on the cheek can be felt. What if there are robotic hubs where global or long distance meetings find place where you can experience physical presence. The lunch break, with clapping each other on the shoulder. And continue conferencing.

Why not going to a conference on the other side of the planet in your robotic suit? Walking, moving and talking to other 'people'. Censoring body temperature, etc. It can be good for a group discussion, a large conference but even fun like dancing or dating. Online communities and long distance relations can be placed in a different perspective.

Projections

The projection 2D and 3D is totally changing the future. It might be normal that we project people in our room, out of our watch, hands, earrings or glasses. The energy is body energized to have a permanent access to these projections to communicate.

BOOST FOOD, FOOD PRINTING AND CRHHG FOOD

In food there are two streams, the space food, quick healthy, small portions with a boost of energy, three portions a day and you are the man or woman. The right mixes of vitamins, sugar, salt and everything else to have a healthy life and still have the hamburger experience and the clean real honest home grown food.

Clean real honest home grown (CRHHG) food

This stream is to produce it, knowing where it comes from, understanding food, the clean reality. Being able to understand nature and the essence of life and take your time to grow your own food, be able to catch your own fish or even share a cow to embrace the effects of our being and deeds. Food industry will be supporting and caring, marketers who tell untrue stories will be just like the financial industry during the credit crisis being attacked on their manipulations and abusive skills. People claim their right to know what they are eating. Why not? Share a chicken, pig or cow, bring back the butcher in the street or the buildings where you can caress, feed and grow your own animals for dinner. Gardening is based on creating food, like home or roof vegetables and fruit. Why not give everybody the food education how to grow, seed and harvest.

Boost food

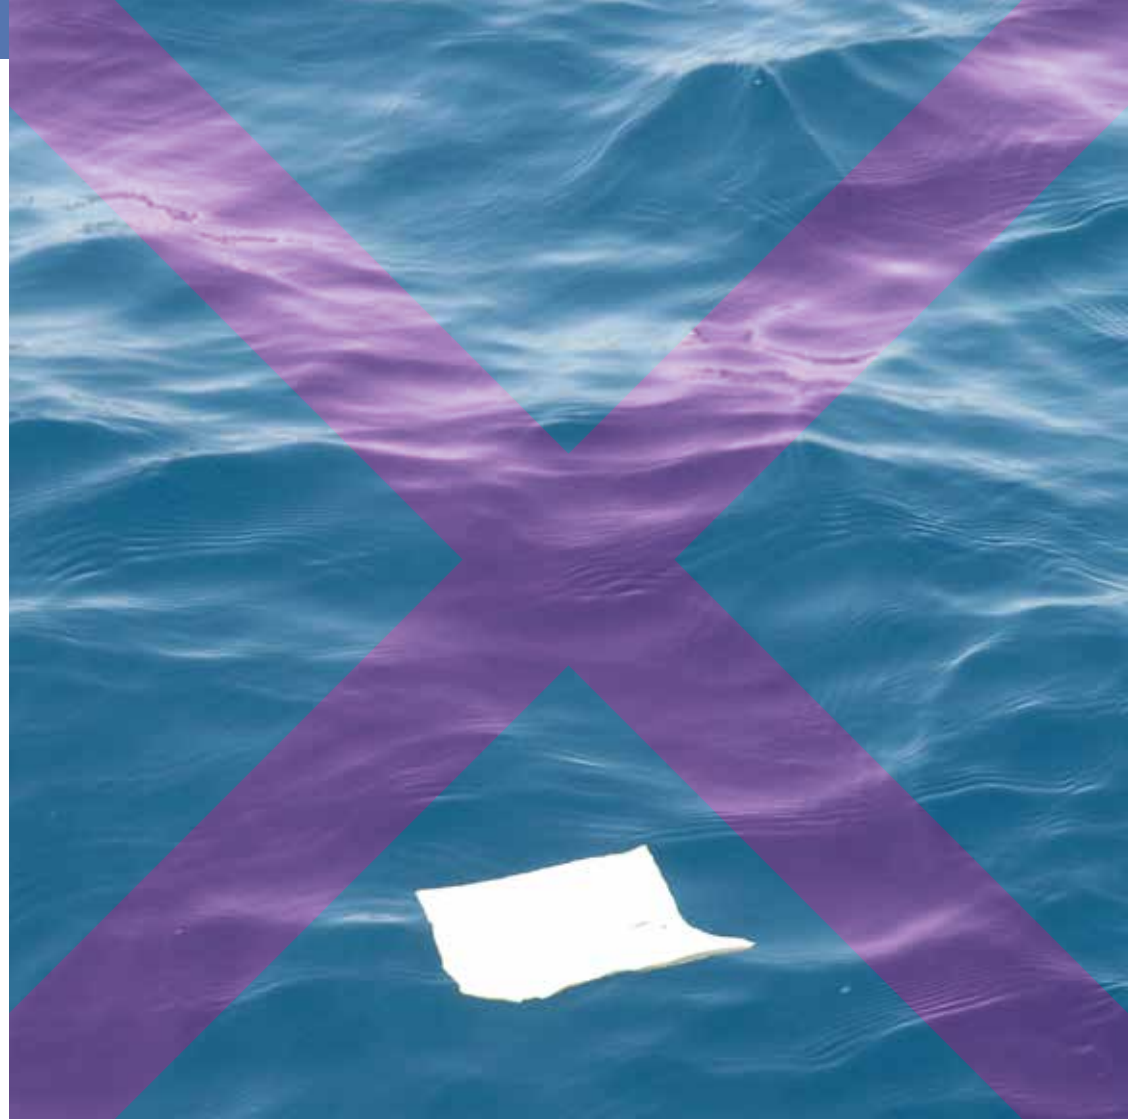

Why not the boost food, the 10-second dinner that fills your body and mind with the right energy, vitamins, contents for a healthy life. It is not eating what you are doing but staying healthy. The eating is not there and you know exactly that the boost food is good for you. The experience of boost food has nothing to do with eating, but fulfilling a nec-

essary need. The joy that eating gives you has to be included, so you really have a good boost food trip. Addiction to food is suppressed in the ingredients in boost food, why not accepting that food is based on surviving instead of addiction.

Food and printing machines

There will be a big shift when creating our own food machines will help, so the seed machine, small energy neutral climate cases to have access to extraordinary vegetables or fruits, burning our own cocoa coffee and cocoa beans. Honey combs on the windows and smart systems to harvest the honey. The ingredients for our own boost food can be generated through our machines. But of course the cocoa burner, mixer and chocolate bar printer and other fun stuff will be part of our lives.

Boost food will be printed from the things we now call food waste and a machine that combines vitamins, supplements and all other stuff that give you a food experience. The machinery will organize and conserve, the printer gives it the shape and ingredients. Printing a boost steak as a replacement for a potato and vegetable meal.

WATER EDUCATION, WATER SKILLS AND SYNTHETICAL WATERDROP LEAVES

In outer space, we are looking for other life, but more exciting is the news when there are trails of water. That means that all our existence depends on water, but even more our personal lives can not run healthily without water. Why not make water the global symbol - the most important ingredient of our lives - the symbol of health, of pride of green, of respect of nature. Create a water anthem, a world water project that is about this water where we even look for outer space. The basic skills to make water, to clean water and to drink water are hopefully the new basic value and skills for the future.

Basic water education

We depend on water. Even when we eat, we use the water that is in our food. Why not educate all people about water, is rain healthy to drink, or how can we make it drinkable? Is it possible to create drinking water without the water company and what do we need to do to filter it to be acceptable and safe? Why not teach children all the basics about water? If we can deal with water, we can deal with our lives.

Purify sea water to drinking water

When lying on the Atlantic beach, we will take our water machine fill it with sea water and spin the wheel a few moments. After about 20 minutes the salt is harvested and the cooled water drinkable.

Desert surviving skills

Why not create a condensation system in the desert to create waterdrops in the desert, the cold nights and the hot days are the ingredients to create water. Maybe synthetic leaves that can produce the condensation.

PRINTING FRESH FOOD, VITAMIN PILLS, NEW PAPER, DESIGNER SHOES AND CLOTHES USING RE-USABLE WASTE

It is not about what to print, but how to print it, here lies the future. When the industrial revolution started to work with production on demand, design your own shoes, cars, etc. The logical steps will be the steps to home production. We produce re-usable waste, for new home printed products.

Today plastic is fully accepted, but is it acceptable for a green future? It might be as long as we can recycle this unbreakable stuff. Re-use alternatives for the package material, easily transform it into 3D print material, as for the future we all will produce more ourselves. Whereas it is now normal to print with ink, it will be normal to print our clothes, lamps, but also in the future guns, electrical circuits and food can be printed. Why not concentrate the food leftovers in re-usable waste for our home 3D printing machines?

The designers in the world that can produce within new to develop standards are the new shopping malls for the future. Maybe the shops are in the beginning full with the machines which people can take their produced re-usable waste to and let produce the new design on demand. Finally it can be home printed.

3D printer for plastic packages and other waste

Why not creating a possibility that ingredients for the 3D printer are created from the plastic waste. The plastic soup in all the oceans can be printed into boats in the middle of

the ocean. The plastic waste at home can be used to create anything you like. And if you don't like it anymore, you re-use the plastic at home. But what if the leather of our shoes and cotton, silk or polyester of our clothes also can be re-used and printed to new shoes or clothes. Why not make a shoes or clothes creator, the sewing machine 5.0 jeans in, jeans out, shoes in shoes out.

Food waste distillery for creating your vitamin pill or speed food

When throwing away food, you can give it to a pig, and finally you eat the pig. So we need a syntactical pig in our houses which eats all the rest of food and makes meat, vitamins or other eatable stuff from it.

Modern mining rich metals from phone and computer waste

There are more rich metals above the ground in waste than in natural resources. Time to be more aware of that and find solutions to save the metals. It is more about recycling, than it is about transforming, so we need mining metal tools to distillate the metals from waste. The funniest part is that metals are reusable and if distilled worth a lot.

Paper factory

Why not create a home paper factory, putting paper in it and getting toilet paper, writing paper in return and if you connect a printer to it, you can print directly from paper waste. Why not?

MIND NAVIGATION, SMALL NETWORKS AND THE BODYNET

The sustainable Internet as a collective movement of change is one of the utmost important things that will change. The connection with the World Wide Web is like water, so the ability to harvest our own internet is important to survive. The change is that every human being will be a carrier of water and Internet. Maybe we call it different Bodynet. As we know the human body is perfectly for kinetic energy which is used to are permanent connected.

Open internet, receiving and tethering

Everybody is using mobile devices, the first step is to stop with the adapters to load batteries. The human body is active enough to have a permanent awake mobile device. Automatic tethering is the next logical step, permanent connection to body powered internet connections.

Authentic networks

Understanding Internet like water is important to find leaks or create own pools of authentic networks open or closed. Small communities that use their own devices as servers and creating new privacy networks far away the big data streams. The big data streams, using the word wide web are not permanently connected anymore because of all the small closed networks. Weather predictions are built in the devices as navigation by the stars, which are normal natural rights.

Bodynet- navigation through the minds

One of the most important changes is in the navigation by mind, the ability to give orders through mind is normal. Communication through mind is the normal button for the internet of things. If you are feeling cold the temperature can rise a bit or otherwise, if you can't see clearly the lights will shine a bit brighter.

Internet of things – Bodynet of things

Not only people are connected and tethering and receiving signals, all materials that can communicate will do this. Climate neutral stones in houses, which give signals when needed to be replaced (every stone and the network of the complete house), roofs show leaks or isolation issues, the growing vegetables or leaves giving signals on the photosynthesis or growth.

12-YEAR-OLD SURGEONS AND AGELESS CRITISM

The talent development starts with the acceptance that there is too much information. Even analyzing big data is a mirage. Even if all the archives of the world and books are digitalized it is the individual mind that decides how to use the information. The challenge is to pick out the individuals that can break through the traditional bodies, the open minds that can deal with the new society. Finding back the societal license to operate for industries, banks and governments, by clear and clean thinking.

New critical mass

The minds that are the utmost criticized are the highly gifted who are starting from their birth to ask critical questions. It is important to have critical questions so we should stimulate kids to harvest the information and bring forward what they feel and like.

Computer education programmes can deliver the best fit individual education and the future schools are more based on social interaction, the learning materials are changing every day.

Why not be a surgeon when you are 12 year old?

The talent stuff and social stuff is where not age but intelligence comes through. Six year old smart children can socialize with their age friends, but learn with twelve-year-old study material and feeding their vision and intelligence. In the future it is possible that a 12 year old brilliant surgeon is active, but in his free time he/she goes to school to learn the social aspects of life.

SNIFFING ELDERLY, CHILD ROTATION AND CRIMINAL CELLS

The group dependent on other people (children, elderly and criminals) will have a natural care system. Criminals might be strange in this context, but they are a bit like egocentric spoiled children and dependent on an organized active society.

This group can be only dealt with in small aware caring groups like family, friends, but also autonomous cells of professionals and family (health and mind care). These cells take responsibility for caring about health and mind. The function of the cells for the dependent person is a combination of professionals, family and friends all on equal level, no hierarchy in organizing care.

Elderly care

All changes are the most difficult for the elderly, but they have the same ego wish of staying in touch with society or surviving technology. Not overseeing the new possibilities but effectively experiencing the mind and health care. The combination with new techniques that probably are sniffing air signaling the getting older issues or potential diseases, the mind and health care anticipates proactive.

Child rotation

When work is mostly done at home, virtual daycare in combination with socializing is the next step. If four children are transported through hubs to four different addresses to play for an hour in an authentic trusted network. Daycare education for the parents to help a bit organizing is common and maybe even standard at schools. The natural connec-

tion of mother, father and children is in balance with work. The working day of six hours is enough to be as effective as the same working of nine hours in the 2014.

Criminal care

The criminals are a caring responsibility of autonomous cells, the difference is that the professionals and if possible family in the cells are taking care of the criminals. The bigger the criminal the tighter the cell.

Title: Why not?

Creative Commons is a global nonprofit organization dedicated to supporting an open and accessible internet that is enriched with free knowledge and creative resources for people around the world to use, share, and cultivate.

Our easy-to-use licenses provide a simple, standardized way to give the public permission to share and use your creative work – on conditions of your choice. CC licenses let you change your copyright terms from the default of “all rights reserved” to “some rights reserved.”

Millions of people use CC licenses on some of the world's most popular platforms for user-generated content. When you use a CC license to share your photos, videos, or blog, your creation joins a globally accessible pool of resources that includes the work of artists, educators, scientists, and governments.

why
not?

As a young kid three important aspects of his life were nature, politics and music and as an autodidact he learned himself to programme and lead organizations. His network contains musicians, professors from (business) universities, students and leisure and political driven people all over the globe. As owner of a canoe business and his *Zonder Stropdas company* (translated Without a Tie company) which often freaks the traditional thinkers out, he is paddling through life, bringing shiny thoughts from a different point of view.

After reading the book “The Shift” from Lynda Gratton, Robbert recognized the shift was already made in his live. In 2011 and 2012 Robbert won two prizes at the Innocentive.com ideation platform with “Large-Scale Uses for Human Machine Teamwork” and “Creative Ways for Drivers to Interact with Information Systems”, lost his sister who died from cancer and paddled on the Amazone river in a canoe in Ecuador.
